## Risk Assessment for

### Heavens Above

An assessment of risk is nothing more than a careful examination of what, in your work could cause harm to people, either yourself or others. The important thing you need to decide is whether a hazard is significant, and whether you have it covered by satisfactory precautions so that the risk is small.

#### 1. Assessing the hazards.

Look only for hazards which you could reasonably expect to result in significant harm under the conditions in which you work. List hazards here.

Wet flooring-could cause the stilt walker to slip and fall Drunken audience members-could push the stilt walker over
-------------------------------------------------------------------------------------------------------------------------

#### 2. Who might be harmed?

Think about groups of people who are especially at risk from the significant hazards you have identified. List those groups here.

The stilt walkers Members of the audience
----------------------------------------------

#### 3. Is the risk adequately controlled?

Have you already taken precautions against the hazards you listed? For example, have you provided adequate information, instruction or training, and have you adequate systems or procedures in place? List existing controls here.

The performance area is checked prior to performing for trip hazards and slipperiness. If performing outside the weather conditions are observed. The taller stilt walker has a pole and both stilt walkers wear knee pads. If the audience members are drinking the performers may suggest earlier performance times.
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### 4. What further action is necessary to control the risk?

What more could you reasonably do for those risks which were not adequately controlled? List the risks here that are not adequately controlled and the action you will take where it is reasonably practicable to do so.

To my knowledge all the risks are adequately controlled.
